Derived Columns & Calculation Logic

This document details the standard formulas and calculation logic for the derived metrics across the referenced datasets. If a specific column below is not present in your CSVs, it may be safely ignored as per your instructions.

sales.csv order.csv

Sales & Order Metrics

Column Name	Formula / Calculation Logic
Gross Sales	Quantity × Unit Price The total revenue generated before any discounts or deductions are applied.
Discount Amount	Gross Sales × Discount Percentage The total monetary value of the discount applied to the item or order.
Net Sales	Gross Sales - Discount Amount The actual revenue realized after discounts are subtracted from the gross sales.
Total Cost (COGS)	Quantity × Unit Cost The total cost of goods sold for the line item.
Gross Profit	Net Sales - Total Cost The profit earned from the sale after deducting the cost of the goods.
Profit Margin (%)	(Gross Profit / Net Sales) × 100 The percentage of revenue that translates into profit.
Order Total	∑(Net Sales) + Tax + Shipping The final amount paid by the customer, aggregated by Order ID.

product.csv

Product & Inventory Metrics

Column Name	Formula / Calculation Logic
Markup Percentage	((Unit Price - Unit Cost) / Unit Cost) × 100 The percentage increase over the base cost used to determine the selling price.
Inventory Value	Stock Quantity × Unit Cost The total financial value of the current stock on hand for a specific product.

customer.csv

Customer Metrics

Column Name	Formula / Calculation Logic
Customer Tenure (Days)	Current Date - Registration Date The total number of days since the customer first registered or purchased.
Recency (Days Since Last Order)	Current Date - Last Order Date Used for RFM analysis to determine how recently a customer engaged.
